TheRock's - Jaguar F-Type Quick Battery Reboot Mod

As always, this is how I did it and not suggesting you do it this way or any other specific way. Do so at your own risk and in any fashion you choose to do it. This guide is simply in the spirit of offering a method that worked for me.
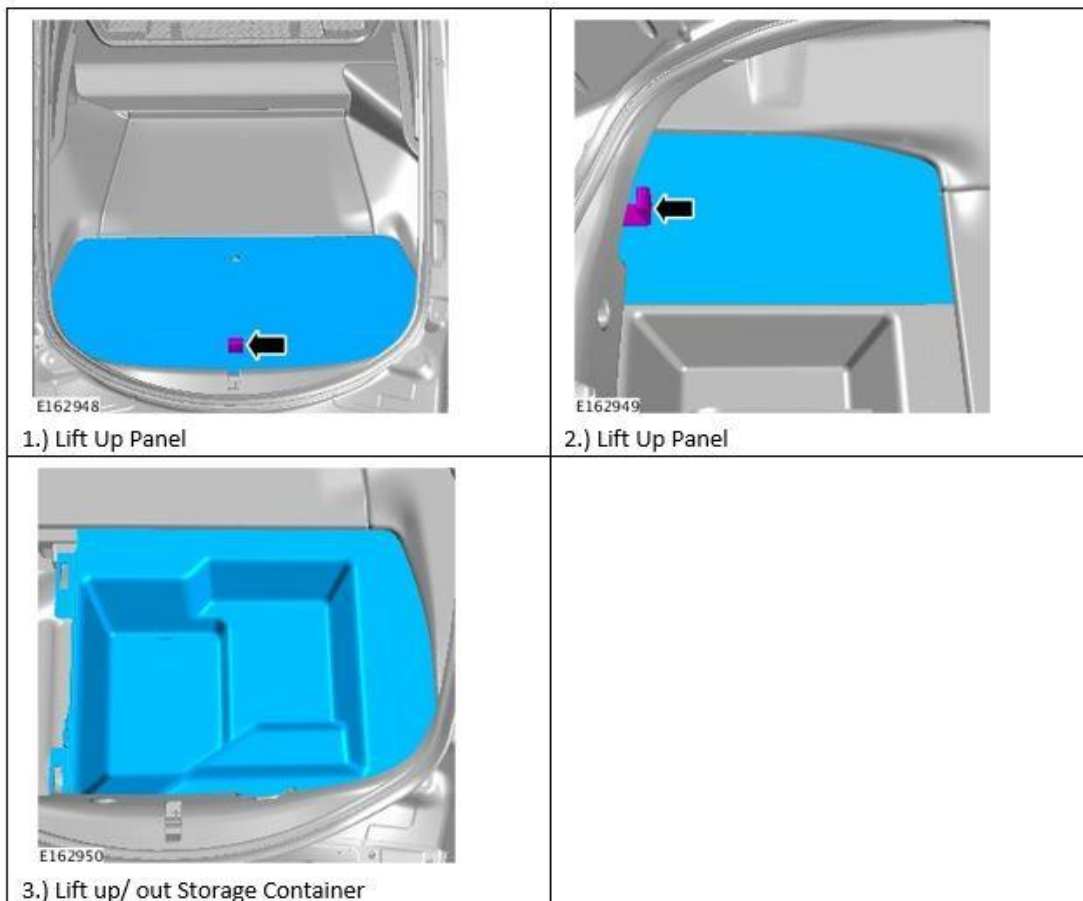

Helpful Tools:

Various metric sockets, ratchets, extensions, wrenches.

Gaining Access and Performing the Mod:

1. For this you simply need to raise the rear Liftgate and remove the storage cover, battery cover, and storage compartment.

Gain Access

Interior Trim Panel Coupe
Removal

E162948
1.) Lift Up Panel

E162949
2.) Lift Up Panel

E162950
3.) Lift up/ out Storage Container

2. **Disconnect Battery** – Negative Terminal

3. **Add Terminal Disconnect Switch** – You can get to it easily now that the panels are out. You remove the ground cable from the bolt/nut in the floor. Then you attach the ground cable to one end of this Disconnect Switch, then the other end goes on the bolt/nut in the floor pan as illustrated:

Easy Battery Re-Boot Solution

Turn Knob 1/4 to Disconnect

Mount Ground Cable

Mount to Grounding Bolt

Attach Negative Cable Here

Attach to bolt in Floorpan

*** *Note: You can use any style/type Terminal Kill switch you like.This is just one example.*

4. **<u>Replace Battery Cable</u>** – Once completed, replace the battery cable to the negative terminal.

Take your time…when done…you should have no extra parts if done right!

This will allow you to simply turn the knob ¼ turn and back, to reboot the battery in the future, as opposed to having to remove the terminal.
