Electrical Guide Format

This Electrical Guide is made up of two major sections. The first section, at the front of the book, provides general information for and about the use of the book, and information and illustrations to aid in the understanding of the Jaguar S-TYPE electrical / electronic systems, as well as the location and identification of components.

The second section includes the Figures, which are the basis of the book. Each Figure is identified by a Figure Number (i.e. Fig. 01.1) and Title, and is accompanied by a page of data containing information specific to that Figure.

It is recommended that the user read through the front section of the book to develop a familiarity with the layout of the book and with the system of symbols and abbreviations used. The Table of Contents should help to guide the user.

Vehicle Identification Numbers (VIN)

VIN ranges are presented throughout the book in the following manner:

→ VIN 123456 indicates “up to VIN 123456”; VIN 123456 → indicates “from VIN 123456 on”.

Jaguar S-TYPE Electrical System Architecture

The Jaguar S-TYPE electrical system is a supply-side switched system. The ignition switch directly carries much of the ignition switched power supply load. Power supply is provided via three methods: direct battery power supply, ignition switched power supply, and switched system power supply.

The switched system power supply is controlled via the GECM and the RECM from SCP messages. After ignition ON, four relays are activated by either the GECM or the RECM for as long as SCP messages remain on the SCP network. The relays will remain activated after ignition OFF, until all SCP messages are removed. Refer to Figure 01.5.

Engine management and transmission control are combined into a single Powertrain Control Module eliminating the need for a controller area network. The Jaguar S-TYPE employs an SCP network for all powertrain, chassis and body systems interface / control. An ACP network is employed for audio and communications systems interface / control.

Circuit ground connections are made at body studs located throughout the vehicle. There are no separate power and logic grounding systems.

The electrical harness incorporates hard-wired front and rear power distribution boxes and a serviceable primary junction box. All fuses and relays (except the trailer towing accessory kit) are located in the two power distribution boxes and the primary junction box.

Figure and Data Page Layout

Figure Pages

Each Figure represents a specific electrical system of the vehicle. The Figures are arranged numerically by system (**01 - Power Distribution, 02 - Battery; Starter; Generator**, etc.) with variations in the system identified by a numeral following a decimal point (**01.1, 01.2**, etc.). Refer to the **Table of Contents: Figures** for a complete list of the Figures.

The Figures **01 - Power Distribution** detail the distribution of power to each of the systems. Numbered reference symbols refer the user to a specific Figure and from a specific Figure back to the Power Distribution Figures. This method eliminates the need to include detailed Power Distribution information on each of the Figures. The reference symbols are defined on page 14.

Each Figure appears on a right-hand page with a corresponding Data page to the left. The Figure and Data pages are folding pages. The user must fold out both pages in order to access all the information provided.

Data Pages

The Data page includes information to assist the user in identifying and locating components, connectors and grounds. This information is supplemented by the illustrations in this front section of the book.

When network data is required for the understanding of a particular circuit, the user is directed to the Appendix.

Where circuits include a Control Module, Pin Out information is provided with values for “active” and “inactive” states. The values listed are approximately those that can be expected at the control module connector pins with all circuit connections made and all components connected and fitted. “Active” means a load is applied or a switch is ON; “inactive” means a load is not applied or a switch is OFF. This information is provided to assist the user in understanding circuit operation and should be used FOR REFERENCE ONLY.

CONTROL MODULE PIN-OUT INFORMATION (FOLD OUT PAGE)

The following abbreviations are used to represent values for Control Module Pin-Out data

I	Input	S	SCP Network	B+	Battery Voltage	Hz	Frequency
O	Output	A	ACP Network	V	Voltage (DC)	kHz	Frequency x 1000
REF	Reference Voltage / Ground	D	Serial and Encoded Data	PWM	Pulse Width Modulated	mA	Milliamperes

CAUTION: The information on this data page is furnished to aid the user in understanding circuit operation. THIS INFORMATION SHOULD BE USED FOR REFERENCE ONLY.

NOTE: The values listed are approximately those that can be expected at the control module connector pins with all circuit connections made and all components connected and fitted. "Active" means a load is applied or a switch is ON; "Inactive" means a load is not applied or a switch is OFF.

Refer to the front of this book for detailed information and illustrations regarding the location and identification of harnesses, relays, fuses, grounds, control modules and control module pins.

Grounds

On Figures where LHD and RHD circuits are combined and the ground designation differs from LHD to RHD, the RHD ground code is shown in parentheses. If the ground designation is the same for LHD and RHD, only one ground code is used, with no parentheses.

EXAMPLE:

Relays

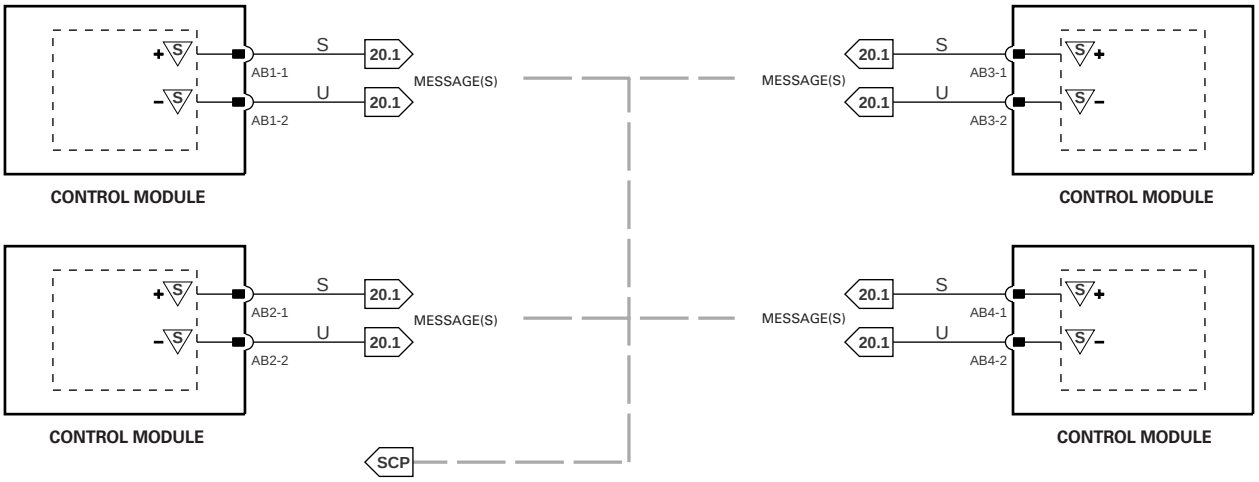
All relays are located in the power distribution boxes and the primary junction box. Relays do not have a separate relay connector (base). Standard relays (full size) use the DIN pin numbering system; micro relays use the ISO pin numbering system. The normally closed circuit (pin 87A or pin 4) is not used in Jaguar S-TYPE vehicles. The relay location number (#1, for example) and the pin numbers are shown inside each relay.

EXAMPLE:

SCP Network

In most instances, the SCP Network is shown as a broken grey line to indicate that there is network communication between the depicted control modules. Refer to Fig. 20.1 for circuit details.

EXAMPLE:



Code Numbering

When numbering connectors, grounds and splices, Jaguar Engineering uses a three-position format: AC001, AC002, etc. Because space is limited in this Electrical Guide, the codes have been shortened. Thus AC001-001 becomes AC1-1, AC002-001 becomes AC2-1, etc.

NOTE: Refer to the Appendix at the rear of this book for SCP Network Messages.

The following abbreviations are used to represent values for Control Module Pin-Out data

I	Input	S	SCP Network	B+	Battery Voltage	Hz	Frequency
O	Output	A	ACP Network	V	Voltage (DC)	kHz	Frequency x 1000
REF	Reference Voltage / Ground	D	Serial and Encoded Data	PWM	Pulse Width Modulated	mA	Milliamperes

CAUTION: The information on this data page is furnished to aid the user in understanding circuit operation. THIS INFORMATION SHOULD BE USED FOR REFERENCE ONLY.

NOTE: The values listed are approximately those that can be expected at the control module connector pins with all circuit connections made and all components connected and fitted. "Active" means a load is applied or a switch is ON; "Inactive" means a load is not applied or a switch is OFF.

CONTROL MODULE PIN-OUT INFORMATION (FOLD OUT PAGE)

Refer to the front of this book for detailed information and illustrations regarding the location and identification of harnesses, relays, fuses, grounds, control modules and control module pins.

SCP NOTE: The switched system power relays are activated by the GECM or the RECM whenever messages are present on the SCP Network. After the ignition is switched off, the relays remain activated until all SCP messages are removed.

CONTROL MODULE PIN-OUT INFORMATION (FOLD OUT PAGE)

Refer to the front of this book for detailed information and illustrations regarding the location and identification of harnesses, relays, fuses, grounds, control modules and control module pins.

NOTE: On leaded fuel vehicles, the Oxygen Sensors are deleted and the Exhaust System fittings are blanked off.

SCP NOTE: The PCM communicates with the Throttle Actuator Control Module for diagnostic purposes only.

NOTE: On vehicles with Dynamic Stability Control, the PCM receives the BRAKE ON / OFF signal (FH1-40) from the DSC Control Module.

The following abbreviations are used to represent values for Control Module Pin-Out data

I	Input	S	SCP Network	B+	Battery Voltage	Hz	Frequency
O	Output	A	ACP Network	V	Voltage (DC)	kHz	Frequency x 1000
REF	Reference Voltage / Ground	D	Serial and Encoded Data	PWM	Pulse Width Modulated	mA	Milliamperes

CAUTION: The information on this data page is furnished to aid the user in understanding circuit operation. THIS INFORMATION SHOULD BE USED FOR REFERENCE ONLY.

NOTE: The values listed are approximately those that can be expected at the control module connector pins with all circuit connections made and all components connected and fitted. "Active" means a load is applied or a switch is ON; "Inactive" means a load is not applied or a switch is OFF.

The following abbreviations are used to represent values for Control Module Pin-Out data

I	**Input**	**S**	**SCP Network**	**B+**	**Battery Voltage**	**Hz**	**Frequency**
O	**Output**	**A**	**ACP Network**	**V**	**Voltage (DC)**	**kHz**	**Frequency x 1000**
REF	**Reference Voltage / Ground**	**D**	**Serial and Encoded Data**	**PWM**	**Pulse Width Modulated**	**mA**	**Milliamperes**

CAUTION: The information on this data page is furnished to aid the user in understanding circuit operation. THIS INFORMATION SHOULD BE USED FOR REFERENCE ONLY.

NOTE: The values listed are approximately those that can be expected at the control module connector pins with all circuit connections made and all components connected and fitted. "Active" means a load is applied or a switch is ON; "Inactive" means a load is not applied or a switch is OFF.

CONTROL MODULE PIN-OUT INFORMATION (FOLD OUT PAGE)

Refer to the front of this book for detailed information and illustrations regarding the location and identification of harnesses, relays, fuses, grounds, control modules and control module pins.

NOTE: Check market specification and / or vehicle option specification for fitment of the following security components:

- STEERING COLUMN LOCK
- INCLINATION SENSOR
- INTRUSION SENSORS
- PASSIVE SECURITY SOUNDER
- ACTIVE SECURITY SOUNDER

NOTE: Refer to the Appendix at the rear of this book for SCP Network Messages.

The following abbreviations are used to represent values for Control Module Pin-Out data

I	Input	S	SCP Network	B+	Battery Voltage	Hz	Frequency
O	Output	A	ACP Network	V	Voltage (DC)	kHz	Frequency x 1000
REF	Reference Voltage / Ground	D	Serial and Encoded Data	PWM	Pulse Width Modulated	mA	Milliamperes

CAUTION: The information on this data page is furnished to aid the user in understanding circuit operation. THIS INFORMATION SHOULD BE USED FOR REFERENCE ONLY.

NOTE: The values listed are approximately those that can be expected at the control module connector pins with all circuit connections made and all components connected and fitted. "Active" means a load is applied or a switch is ON; "Inactive" means a load is not applied or a switch is OFF.
